**Water Board of Lemesos and KIOS Research and Innovation Center of Excellence:  
A mutual benefit partnership**

The Water Board of Lemesos (WBL) has been a strategic partner and a collaborator of the KIOS Research and Innovation Center of Excellence (University of Cyprus) since 2008. The benefits of this long-term collaboration are numerous for both organisations.

On the one hand, through this partnership, WBL has considerably improved its ability to monitor and timely detect leakages in the water supply network of Limassol, while significantly reducing its repair response time. Using innovative tools, WBL upgrades the services provided to its consumers and improves the management of its water resources, which constitute a priority for the Board.

On the other hand, KIOS has seized the opportunity to conduct cutting-edge scientific research in order to develop innovative methods that aim to ensure the monitoring, control, safety and management of water, while enhancing the know-how and expertise of its researchers on smart water supply networks.

# Greatest, however, is water

Pindar

Thanks to the positive results of this successful partnership, both parties aim to continue their common research and innovation activities on new inspiring subjects, such as the dynamic monitoring of the water supply network.

Both organisations aspire to develop modern methods of operating Lemeso's water supply infrastructure.
